

ABSTRACT

A means for creating perpetual motion of a battery operated fan module has been disclosed. A battery-operated device such as a fan can be operated continuously without interruption for an indefinite period.

This can be accomplished by recycling wasted or unused energy within the device, in such a manner, as to continuously reuse the same energy source eliminating the need for any external energy to keep the said device in operation. This can be accomplished by installing a charging component in such a manner as to deliver a pulsating current and bumping said current back to the battery.
